

YOUR HANDS-OFF GUIDE

Income and Expense Tracker

Statements in. Money sorted.

A money tracker in one file. Drop in your bank and card downloads and see where every dollar went, without typing a single purchase.

ONE FILE · WORKS OFFLINE · YOUR OWN BACKUPS

What you downloaded.

Read this page first. The rest is here whenever you need it.

FILE	WHAT IT IS
IncomeExpenseTracker.html	The whole app, in one file. This is the product.
Income_Expense_Tracker_Guide.pdf	This guide.
START_HERE.txt	The short version of this page.
LICENCE.txt	What you may and may not do with the file.

The HTML file is not a document that opens an app: it **is** the app. The code, fonts and charts are all inside it, and nothing is downloaded when you use it.

Setting up: about ten minutes

1. **Extract the ZIP** into a folder you will find again. A synced folder (iCloud Drive, Dropbox, OneDrive, Google Drive) is ideal.
2. **Double-click IncomeExpenseTracker.html**. It opens in Chrome, Edge, Safari or Firefox like a web page, and works offline from then on.
3. **Take the welcome tour**. A few short slides on adding statements, what gets counted, and backups.
4. **Add your first statements** on Add statements: last month from every card and bank, all at once.
5. **Download a backup** from Settings & backup. Page 9 explains why it matters more than anything else here.

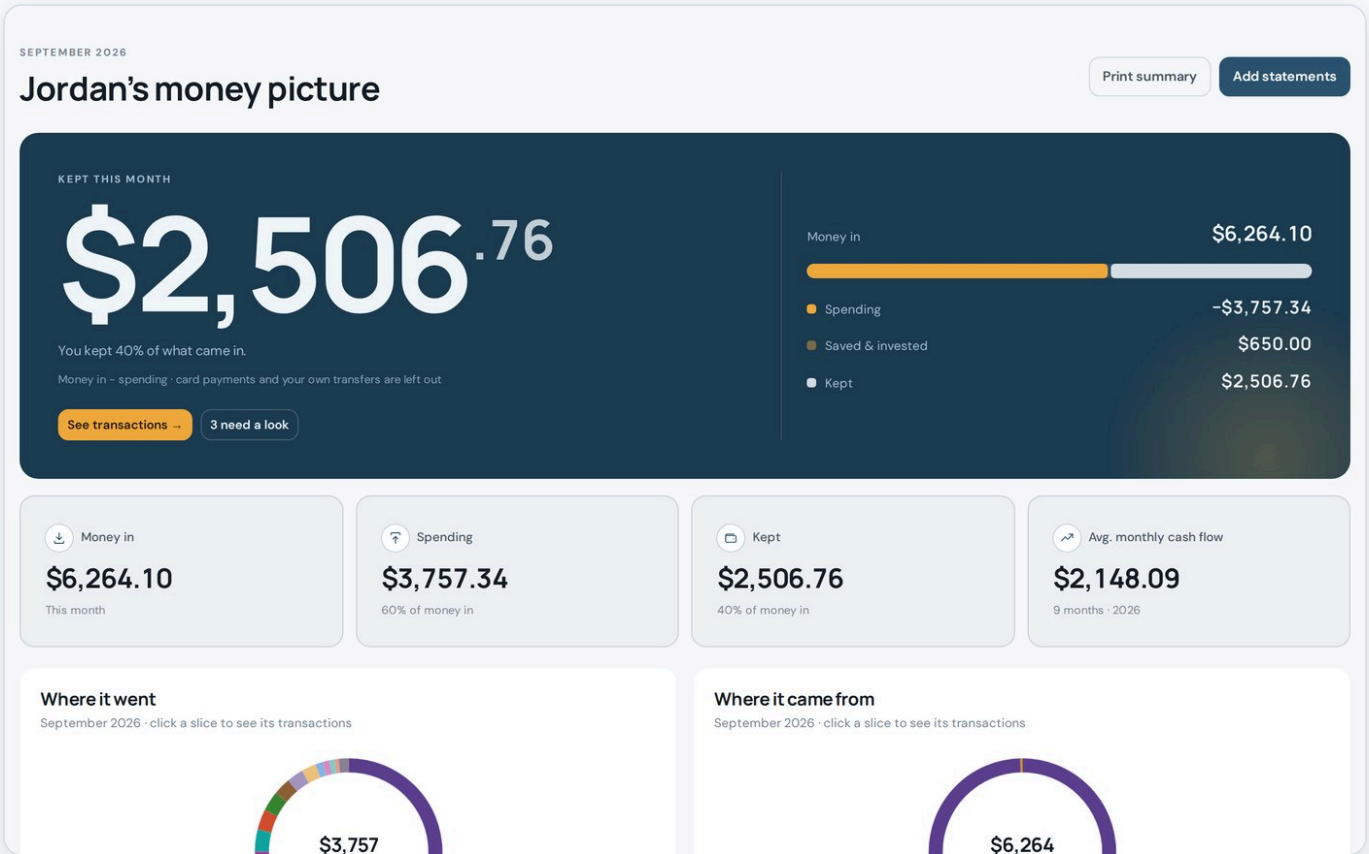

Want to look around first?

Choose **Explore sample data** on the welcome screen or in Settings & backup. A fictional household fills every screen, in a separate session. **Return to my money** brings back your own figures, untouched.

Where it went, without typing.

Income and Expense Tracker answers one question first: how much did you keep this month?

The Money picture. **Kept** is money in less spending, for the month you choose at the top.

WORD	WHAT IT MEANS
Money in	Paychecks and other income.
Spending	Everything that left, less refunds.
Kept	Money in - spending.
Not counted	Card payments and transfers between your own accounts. The purchases were already counted once.

Three steps. Then it runs itself.

Download, drop in, glance. Next month takes about two minutes.

STATEMENTS

Add statements

Every card and bank account, as many files as you like. Each one is read, sorted and paired by itself.

Drop more statements

CSV downloads from your cards and bank accounts, as many as you like at once. They're read on this computer and sorted by themselves.

Choose files

Nothing is uploaded. Long card and account numbers are hidden as soon as a file is read.

Statements folder

Pick the folder your downloads go to. New statement files saved there are added by themselves each time you open the app.

Choose folder

Your accounts

Found from your files. Rename one, fix its type (checking, card, savings...), or archive one you've closed. The type decides how money in and out are read.

Search this table

Latest transaction: all

ACCOUNT :	TYPE :	CURRENCY :	LATEST TRANSACTION :	TRANSACTIONS :	STATUS :	ACTIONS
Checking ••4410	Checking	USD	Oct 3	99	Active	Swap in/out Archive Delete

1. **Download.** Sign in to each bank or card website, open the account, and choose **Download** or **Export** on the transactions list. Pick **CSV** (sometimes “Spreadsheet” or “Comma delimited”) and a date range.
2. **Drop them in.** All files at once on **Add statements**. Each line is read, the merchant name cleaned up, sorted into a category, and card payments and transfers are paired.
3. **Glance.** Clear the few in **Needs a look**, then read your money picture.

Overlaps are safe

Transactions already in the app are skipped, even when two statements overlap by a few days. Two identical purchases on the same day in one file are both kept.

CSV, not PDF

PDF statements can't be read. Almost every US bank, card, PayPal and Venmo offers a CSV download.

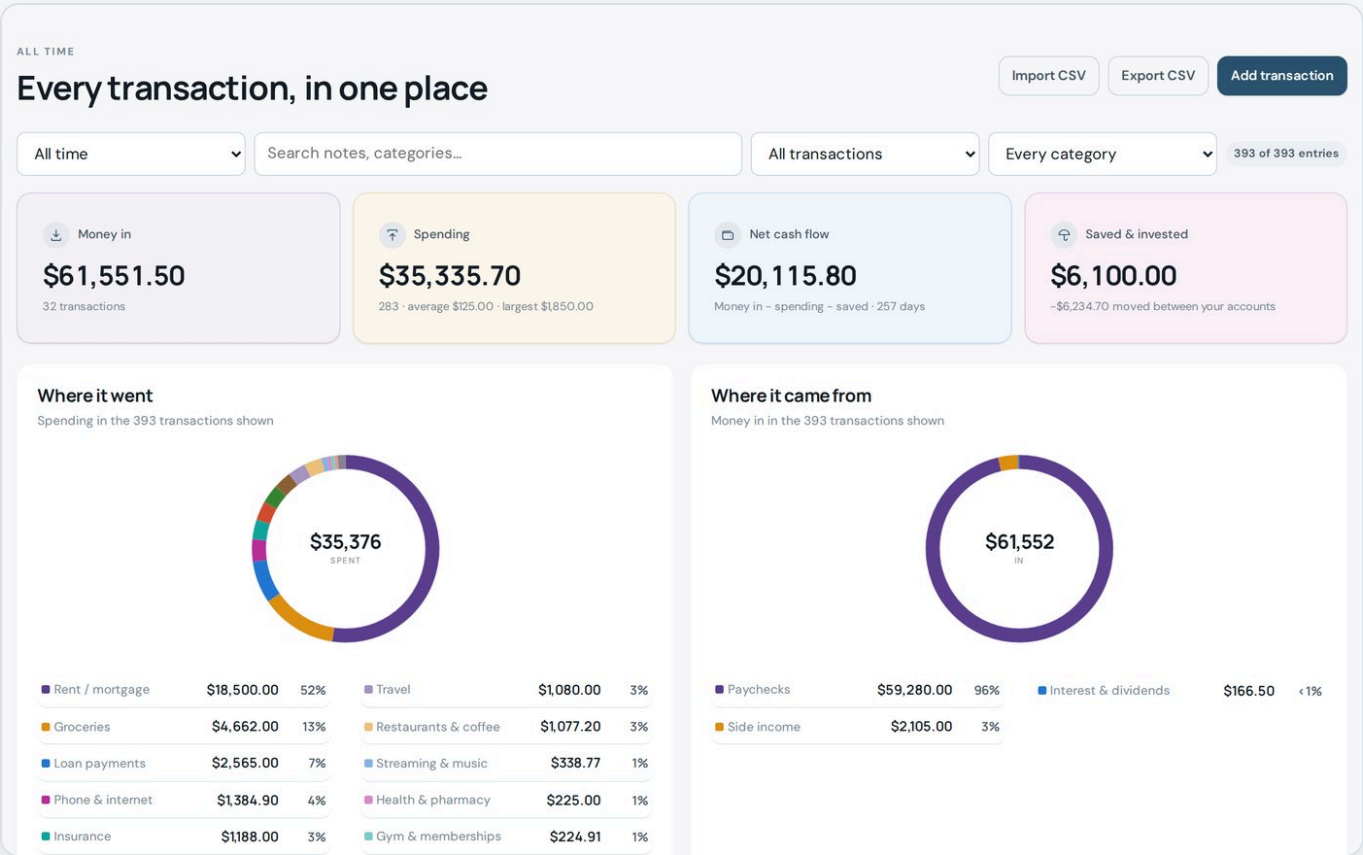

INCOME AND EXPENSE TRACKER | JPS DIGITAL PAGES

4

It learns from you.

Change a category once and the app remembers it for that place from then on.

Transactions. Search, filter by account, category or type, and sort any column.

Something's in the wrong category	Change it on the transaction. You're asked whether to change the others from the same place and remember it. Your choice always wins over the built-in list.
Needs a look	The few it couldn't place wait here. Pick a category; it learns.
Accounts	Each file becomes an account. Rename it, set its type (checking, card, savings...) or archive one you've closed. The type decides how money in and out is read.
Statements folder	Chrome and Edge: point it at your downloads folder on Add statements and new statement files come in by themselves each time you open the app.

Long card and account numbers are hidden as soon as a file is read. Only the last four digits are kept.

The screens.

The main screens are on from the start. Switch the rest on in Settings & backup → **Simplify your sidebar.**

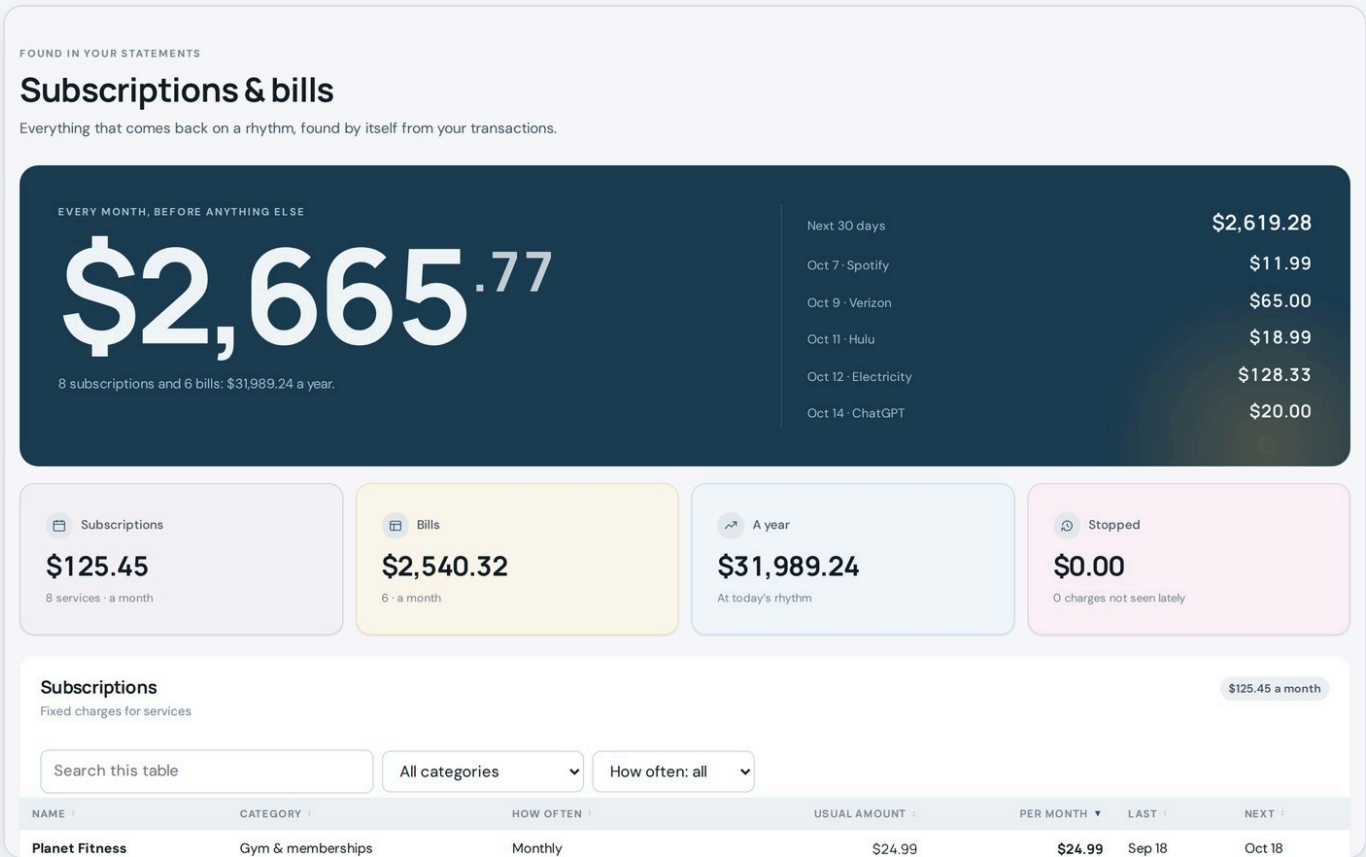

SCREEN	WHAT IT IS FOR
Money picture	Money in, spending, saved and kept, where it went and where it came from.
Transactions	Every line from every statement, searchable and filterable.
Subscriptions & bills	Everything that repeats, its monthly and yearly cost, and the next date.
Year at a glance	Averages, best and worst months, category trends. Year over year beside it.
Cut back	Pick what to cancel or trim and see what it adds up to in a year.
Net worth	Checking, savings, brokerage and retirement, less cards and loans.
Insights	What changed: categories above your usual, price increases, new places, fees.
Paychecks	Gross pay, taxes and 401(k) from your pay stub (optional).
Add statements · Needs a look · Accounts	Statements: files in, the few it's unsure of, and your accounts.
Plan (optional)	Spending limits, savings goals, reminders, a calendar, monthly snapshots and a weekly review.
Settings & backup	Name, currency, date format, 8 themes, your sidebar, backups.

Every screen prints cleanly. Every table sorts, searches and filters.

What repeats, and what to cut.

Subscriptions and bills are found by themselves from your transactions. Nothing to set up.

Every repeating charge, what it costs a month and a year, and the date it lands next. A price increase is flagged.

Cut back

Ideas come from your own spending: a subscription, a category running above your usual. Apply one and see the monthly and yearly total, and what it grows to if you invest it.

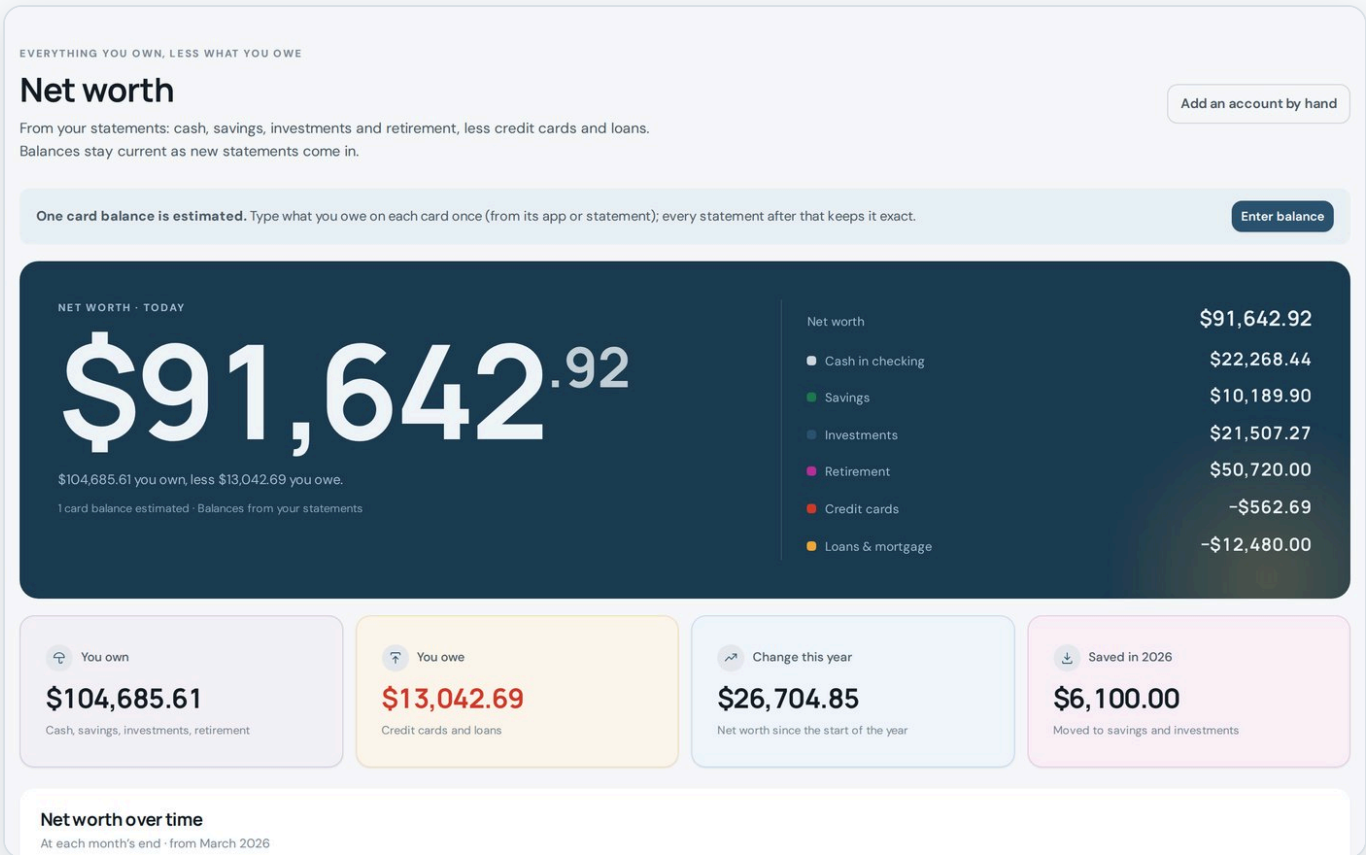

Insights

Categories higher or lower than your usual month, new places you spent at, your biggest purchases, fees and interest, and the charges coming up in the next three weeks.

The rest of the picture.

Savings, investments, cards and loans: what you own less what you owe.

Savings accounts	Drop their transactions CSV in like checking. Money moved there from checking counts as saved , not spent.
Brokerage and retirement	From Fidelity, Vanguard, Schwab and others, the positions or holdings download gives each account's balance; the activity download adds contributions.
Card balances	Card downloads don't include the balance. Type what you owe once with Enter balance ; every statement after that keeps it current.
Paychecks	Your bank only sees take-home pay. Switch on Paychecks, enter one recent pay stub per employer, and every paycheck is broken down by itself.

Keeping your money safe.

Everything lives in your browser, on your device. Nothing is sent anywhere, there is no account, and nobody else holds a copy, including us.

Your entries live in browser storage: please read

- Everything you enter or import is saved automatically in that browser's local storage.
- Clearing your cache, history or site data will permanently delete it.
- It does not carry across browsers: data added in Chrome will not appear in Safari.
- The HTML file does not contain your entries. Copying the file does not copy your data.

Do one of these. Ideally both.

Download backup: every browser

Settings & backup → **Download backup**. One JSON file holding every account, transaction, category and setting. **Restore backup** brings it back on any computer. The app reminds you when a backup is due.

Daily folder backup: Chrome or Edge

Choose a synced folder once (iCloud Drive, Dropbox, OneDrive, Google Drive) and a dated copy is written each day you make changes. Safari and Firefox do not offer this; use Download backup instead.

Moving to another computer

Copy the HTML file and your latest backup across, open the file, then Settings & backup → **Restore backup**.

A few useful fixes.

WHAT YOU SEE	WHAT TO DO
It opens as code, not an app	Extract the ZIP first, then right-click the file → Open with → your browser.
My numbers are gone	Check it is the same browser and profile you used before. Otherwise, Restore backup.
A file wasn't recognized	Check it is the CSV download, not a PDF. On Add statements, Map a file by hand reads any CSV.
Spending looks doubled	Add the checking account's file too, so card payments can be paired. Check each account's type on Accounts.
A category is wrong	Change it on the transaction and choose to remember it.
Net worth looks off	Enter each card's balance once, and add the holdings download for investment accounts.
Folder backup unavailable	Use Chrome or Edge on a computer, or Download backup instead.
The currency is wrong	Settings & backup → Currency, or type your own symbol. Amounts are not converted.
I want the tour again	Settings & backup → Welcome tour → Show tour.

We can help
